Re: Senior Technical Consultant, Modern Data Center — Azure Local & Hyper-V

Dear AHEAD Hiring Team,

I led my company's migration off VMware onto Hyper-V, and I run hyper-converged hosts on Storage Spaces Direct today. That covers a good share of what this role is asking for, so I'll be direct about both what I bring and what I don't.

At Overhead Door Corporation I manage 500+ Windows and Linux servers across Hyper-V, VMware, and Nutanix, spread over multiple physical sites. I planned and executed the VMware-to-Hyper-V migration without interrupting production. I built the hyper-converged Storage Spaces Direct hosts and the failover clusters behind our high-availability workloads, standardized day-to-day management on Windows Admin Center, and automate the estate in PowerShell — including certificate issuance and renewal across Windows, F5 BIG-IP, and Oracle Cloud Infrastructure. I own Active Directory, DNS, and Group Policy end to end, and I converted our WAN from MPLS to SD-WAN.

The gap, stated plainly: I have not deployed Azure Local itself. I have the substrate — Storage Spaces Direct, failover clustering, Windows Admin Center, Azure IaaS — but not the Arc registration, Network ATC, and cluster validation layer on top of it. That's a defined body of work rather than a new discipline, and it's the first thing I'd close. I'd rather say so here than have it surface in a technical screen.

I've also worked this from the delivery side. At Smart Shared Services I ran client engagements as the voice engineering lead — readiness assessments, designs, migrations, and the documentation and knowledge transfer clients needed to operate what I built. Before that I spent six years as IT Director at Village Communities, owning the budget and vendor relationships and running a JD Edwards EnterpriseOne conversion alongside the CFO. Consulting delivery and talking to executives about risk and dependencies aren't new territory.

One last thing, because your posting mentions it in three separate places: documentation is the part of this work I'm known for. Runbooks, as-builts, and migration procedures are usually the first thing to get skipped under schedule pressure, and they're the reason a handoff either holds or doesn't.

I'd welcome the conversation.

Michael George
