SUMMARY

Seventeen years in enterprise compute and virtualization. I currently run a 500+ server Windows and Linux estate across Hyper-V, VMware, and Nutanix for a national manufacturer, where I led the migration off VMware onto Hyper-V, built hyper-converged hosts on Storage Spaces Direct behind Windows Failover Clustering, and manage the environment day to day through Windows Admin Center and PowerShell. I've also delivered client-facing engagements as a consulting voice engineer, and spent six years as an IT Director owning infrastructure, budget, and vendor relationships outright. The documentation and runbooks I write are the ones teams actually open during an incident.

EXPERIENCE

System Network Administrator — Overhead Door Corporation

Columbus, OH | March 2019 – Present

- **Led the migration from VMware to Hyper-V**, planning and executing the move of production workloads across multiple sites without interrupting the business.
- Built and operate **hyper-converged Hyper-V hosts on Storage Spaces Direct**, with Windows Failover Clustering behind the high-availability workloads.
- Manage **500+ Windows and Linux virtual servers** across multiple physical sites on Hyper-V with SCVMM, VMware vCenter and vSAN, and Nutanix.
- Standardized day-to-day host and server management on **Windows Admin Center**.
- Build and run virtual machines in **Azure** alongside the on-premises estate, and automate Azure and Oracle Cloud Infrastructure operations in **PowerShell**.
- Own **Active Directory** end to end — sites and services, replication topology, OU structure, **Group Policy** design, LDAPs, and DFS — plus internal and external **DNS**, DHCP, and all inbound and outbound SMTP routing.
- Own the storage estate across five platforms — Nimble, NetApp, EMC, Compellent, and Isilon — including capacity planning and performance analysis.
- **Converted the WAN from MPLS to SD-WAN**, running FortiGate over Cisco infrastructure and replacing fixed carrier circuits with a design that routes around failures on its own.
- Automated certificate issuance and renewal across three platforms — Windows and Active Directory, F5 BIG-IP, and Oracle Cloud Infrastructure — closing off the expiry outages that come with tracking certificates by hand.
- Deployed **Windows Event Forwarding** for centralized event collection and built account lockout analytics, making a recurring support burden diagnosable at the source instead of one reset ticket at a time.
- Automated server and printer deployment in PowerShell, and replaced a hardware inventory that had previously been collected by hand.
- Write the **as-built documentation, network and process diagrams, and backup and recovery runbooks** the team relies on, and implement all changes under formal change control.
- Third-level escalation point for complex infrastructure issues across compute, storage, networking, and hardware; after-hours on-call on a six-week rotation.

Skype for Business / Teams Voice Engineer — Smart Shared Services

May 2018 – April 2019

- Delivered **client engagements** as the voice engineering lead — ran readiness and telephony assessments, produced the designs, and executed the migrations.
- Migrated enterprise voice from Lync to Skype for Business, and configured Sonus session border controllers for SIP trunking.
- Automated provisioning and policy enforcement in **PowerShell**, replacing per-user manual configuration.
- Translated business requirements into technical designs, then handed clients the operational documentation and **knowledge transfer** needed to run them.

IT Director — Village Communities

Westerville, OH | July 2011 – August 2017

- Hired to run IT for the organization and owned it outright — infrastructure, budget, vendor contracts, and services for 150–250 employees and roughly 500 network accounts.
- **Consolidated physical servers onto Hyper-V**, and added a Nimble SAN for VM storage with site-to-site replication and backup.
- Led the JD Edwards EnterpriseOne conversion from 8.11 to 9.1 with the CFO, carrying the full CNC workload — package builds, OCM mappings, object promotions, ESUs and tools releases, environment creation and refresh, and Server Manager administration.

- Upgraded a multi-domain Windows environment across Server 2000, 2003, and 2012, and restructured Exchange by department and company.
- Deployed **Peplink SpeedFusion** bonded VPN across sites for circuit failover and throughput — an SD-WAN approach before the term was in common use — over Cisco WAN routing with OSPF, EIGRP, and RIP.
- Re-architected the network into segmented layers, eliminating broadcast storms and separating management traffic from end users.
- Operated a centralized ISP service for other tenants in the buildings, making IT a revenue line rather than only a cost center.

Systems Administrator — ADiO Pharmacy

October 2009 – July 2011

- Managed Exchange across multiple domains, plus SharePoint, web, terminal, and domain servers.
- Deployed VMware Server and installed Unix servers inside Windows 2003 and 2008 domains with **failover clustering**; owned backups across the estate.
- Scripted routine administration in VBScript and PowerShell, and administered VPN, wireless, NAS storage, and SonicWall firewalls.

Earlier

Network Administrator, Peer Assist (January – October 2009) — network and security administration, VOIP, cabling, and SQL databases behind in-house applications.

Customer Service Representative, Definitive Homecare Solutions (October 2007 – November 2008) — supported the CPR+ client-server application and built SQL reports against its data model.

TECHNICAL SKILLS

- **Virtualization & HCI:** Hyper-V, Windows Failover Clustering, Cluster Shared Volumes, live migration, Storage Spaces Direct, SCVMM, Windows Admin Center, VMware vSphere/vCenter/ESXi/vSAN, Nutanix, Citrix XenApp, VDI
- **Windows Server:** Server 2000 through current, Active Directory, Group Policy, DNS, DHCP, LDAPS, DFS, certificate services, SMTP
- **Cloud & Hybrid:** Azure IaaS, Oracle Cloud Infrastructure, Microsoft 365, Exchange, SharePoint, Teams
- **Storage:** Storage Spaces Direct, vSAN, Nimble, NetApp, EMC, Compellent, Isilon
- **Automation:** PowerShell, VBScript; AI-assisted scripting and design work (Claude, ChatGPT, Gemini, Google AI Studio)
- **Networking:** Cisco, FortiGate SD-WAN, Peplink SpeedFusion, MPLS, F5 BIG-IP, OSPF, EIGRP, RIP, VLAN segmentation, spanning tree, VPN
- **Monitoring & Operations:** Windows Event Forwarding, System Center (Operations Manager, Data Protection Manager, Service Manager), change control, as-built documentation, runbooks
- **Voice:** Skype for Business, Teams Voice, Sonus SBC, SIP, H.323, Avaya
- **Business Systems:** JD Edwards EnterpriseOne (CNC), SQL Server, Yardi, PeopleSoft

EDUCATION

Columbus State Community College — Computer Science coursework: C, COBOL, Assembler, JCL, Visual Basic, AS/400 CL
